

# Express Challenge

---

Now we want you to build a RESTful API using Node.js and Postgres **dvdrental** database.

You should provide endpoints for the tables such as **actors**, **films** and other tables you like the sound of.

You should provide search capabilities to;

- Show all items from the object
- Show a specific object by **id** or **by name**
- Add an update feature to change specific values for an object

Your service should return:

- A valid HTTP RESPONSE code
  - 200 OK if the action was successful
  - 403 if the document was not found or no data returned
- The data as JSON
  - Or an error message in JSON
